On the Cover

A T2-weighted axial MRI demonstrating a large pleomorphic adenoma filling the right parapharyngeal space. The tumor extends from the deep lobe of the parotid to the soft palate. It passes through the stylomandibular tunnel resulting in its dumbbell shape. The removal of tumors in the parapharyngeal space can be accomplished through a variety of approaches. Transoral robotic surgery is a useful technique, but patients must be appropriately selected based on the location and the extent of their tumor.
