Sup_Figure 1 Connert et al., 2006
Supplementary Figure 1 General characterization of the mabp1\(^{-/-}\) phenotype. (A) Compared to wild-type mice (left panel), mabp1-deficient mice possess ruffled up fur and hunched posture (middle panel), and partial paralysis of hind limbs (right panel). (B) Growth curves showing body weights [g] of female (left) and male (right) mabp1\(^{+/+}\) (closed triangles), mabp1\(^{+/-}\) (open rectangles) and mabp1\(^{-/-}\) (closed circles) mice measured between 3 and 15 weeks of age (n=8 for each genotype and gender).
