Supplementary Figures for:

Movement propensity and ability correlate with ecological specialisation in European land snails: comparative analysis of a dispersal syndrome

Maxime Dahirel, Eric Olivier, Annie Guiller, Marie-Claire Martin, Luc Madec and Armelle Ansart

**Figure S1.** Map of the collection sites in France and Italy. See Table 1 in the main article for detailed coordinates. Base map by EuroStat (http://epp.eurostat.ec.europa.eu/portal/page/portal/gisco_Geographical_information_maps/po
pups/references/administrative_units_statistical_units_1), © EuroGeographics for the administrative boundaries
Figure S2. Relationship between habitat specialization (measured by the PDI value), and mean clutch mass. Residuals from a preliminary regression on $\log_{10}$(body mass) are plotted against PDI values. Fitted values from a PGLS (line) are presented for illustration purposes only ($R^2=0.32$ for the partial regression presented here and 0.98 for the full model including body mass).
