Figure S1. Relative expression of all type-II *Arabidopsis* MCP genes in various tissues in response to stress treatments as determined by analysis of the GENEVESTIGATOR DNA microarray dataset Version 3 (https://www.genevestigator.com/gv/index.jsp). The meta-profile data for individual type-II *AtMCPs* was extracted from stimulus data set, which are shown as numbers of arrays with experiments provided by analysis tool of GENEVESTIGATOR. Relative expression level is shown as heat map with normalized expression value as scaled with color intensity. The highest and lowest expression corresponds to bright red and green, respectively.
