Fig. S15. Sensitivity analysis: reducing the sensitivity of the ELISA test to 90% for low virulent CSF

The 10th, 50th and 90th percentiles of the duration of the HRP and the number of the infected farms at the end of the HRP are presented for 14 surveillance setup scenarios with the low virulent strain.

The surveillance setup scenarios with square-shaped medians are the most efficient among the scenarios evaluated.
