Old Roads—New Connections

Guest Editor: Helen Michelakakis

Annual Meeting of the SSIEM, Athens, Greece, 4-7 September 2018

OLD ROADS NEW CONNECTIONS

Guest Editor: Helen Michelakakis
CONTENTS

1  “Old Roads—New Connections” SSIEM 2018 Annual Symposium in Athens
   H. Michelakakis

2  The effectiveness of correcting abnormal metabolic profiles
   It is possible to evaluate the efficacy of a treatment even if you only have one patient, provided you can show that you have
   corrected a potentially toxic metabolite profile
   P. T. Clayton

14  Inborn errors of metabolite repair
   Metabolite repair enzymes serve to destroy toxic side-products made by classical enzymes of intermediary metabolism, and their
   deficiency causes a new category of inborn errors of metabolism
   M. Veiga-da-Cunha, E. Van Schaftingen and G. T. Bommer

25  The diagnosis of inborn errors of metabolism by an integrative “multi-omics” approach: A perspective encompassing
    genomics, transcriptomics, and proteomics
   The parallel analysis of multi-omics methodologies increases the capability to decipher the molecular genetic cause of a patient’s
   disease
   S. L. Stenton, L. S. Kremer, R. Kopajtich, C. Ludwig and H. Prokisch

36  Recent advances in understanding the molecular genetic basis of mitochondrial disease
   A ‘multi-omics’ approach has the potential to increase even further the diagnostic yield and will no doubt result in the identification
   of new disease genes
   and R. W. Taylor

51  Novel insights into the clinical and molecular spectrum of congenital disorders of autophagy
   Congenital disorders of autophagy are an emerging group of single-gene disorders that provide insights into the role of autophagy
   in central nervous system development and function
   J. Teinert, R. Beine, M. Wimmer and D. Ebrahimi-Fakhari

63  Exploiting epigenetics for the treatment of inborn errors of metabolism
   Epigenetic editing is a novel and potentially valuable approach for the treatment of inborn errors of metabolism
   M. G. S. Rutten, M. G. Rots and M. H. Oosterveer

71  Organelle interplay—peroxisome interactions in health and disease
   A better understanding of organelle contacts may lead to therapeutic approaches that allow specific targeting and modulation
   of tethering complexes to combat degenerative diseases
   M. Schrader, M. Kamoshita and M. Islinger

90  CDG and immune response: From bedside to bench and back
   Abnormal glycosylation can be associated with deranged immune responses
   C. Pascoal, R. Francisco, T. Ferro, V. dos Reis Ferreira, J. Jaeken and P. A. Videira

125  Treating lysosomal storage disorders: What have we learnt?
   Different approaches to drug development and licensing are conceivable and it is time that the lessons we have learnt over ten years
   of treating LSDs are used to inform how we develop treatments for rare diseases in the future
   R. H. Lachmann

Continues on the inside back cover
133  Bone development and remodeling in metabolic disorders
Bone defects are frequent in various metabolic diseases, yet they are not well understood, which is illustrated in multiple hereditary exostosis, Gaucher disease and atypical femoral fractures
J. Serra-Vinardell, N. Roca-Ayats, L. De-Ugarte, L. Vilageliu, S. Balcells and D. Grinberg

145  Inborn errors of metabolism leading to neuronal migration defects
Inborn errors of metabolism are a rare but important differential diagnosis of neuronal migration defects
S. Schiller, H. Rosewich, S. Grünewald and J. Gärtnern

156  Erratum
