The Journal is known for welcoming contributions in a wide range of areas: computational and mechanical engineering, multi-physics or multi-disciplinary problems, and on new, emerging topics. Manuscripts should have sufficient original numerical content, and generate new knowledge that is applicable to general classes of engineering problems, and not be limited to applications of existing methods, or propose incremental improvements to existing methods. The journal publishes full-length papers, which should normally be less than 25 journal pages in length, and short communications, which can be at most 8 journal pages. Discussions of papers in print can be published, but two-part papers will not be considered for review.
Research Articles
A shape optimization approach for simulating contact of elastic membranes with rigid obstacles: A. Sharma and R. Rangarajan ........................................................................................................................................... 371
A hybrid variational Allen-Cahn/ALE scheme for the coupled analysis of two-phase fluid-structure interaction: V. Joshi and R. K. Jaiman .................................................................................................................................................. 405
An efficient runtime mesh smoothing technique for 3D explicit Lagrangian free-surface fluid flow simulations: S. Meduri, M. Cremonesi and U. Perego ........................................................................................................................................ 430
Automatic and efficient hybrid viscous mesh generation based on clipped Voronoi diagrams: Y. Gan and J. Liu .................................................................................................................................................. 453
Corrigendum
Goal-oriented adaptivity for linear elastic micromorphic continua based on primal and adjoint consistency analysis: X. Ju and R. Mahnken ........................................................................................................................................... 472

E-mail Alerting
To receive Tables of Contents via email as they are published online, sign up for Contents Alert on the Journal’s homepage

The International Journal for Numerical Methods in Engineering is complemented by the companion journals International Journal for Numerical Methods in Fluids, International Journal for Numerical and Analytical Methods in Geomechanics, and International Journal for Numerical Methods in Biomedical Engineering. Further details on these journals can be found at the website:
