Corrections

Volume 25 (No.1), January 1993

In the paper by S. Valberg, L. Jönsson, A. Lindholm and N. Holmgren entitled "Muscle histopathology and plasma aspartate aminotransferase, creatine kinase and myoglobin changes with exercise in horses with recurrent exertional rhabdomyolysis", it is regretted that the y axis values of Figures 1 and 2 were incorrectly printed with a 10-fold error. The correct versions of the figures are given below.

Fig 1: The activities of plasma AST and CK before, during and for 24 h after submaximal exercise. Individual values are shown for Horses A–F and 95% confidence intervals for control horses are represented by the shaded area.

Fig 2: The activities of plasma AST and CK before, during and for 24 h after near-maximal exercise. Individual values are shown for Horses A–F and 95% confidence intervals for control horses are represented by the shaded area.
