

## Call for Papers on Climate Change and Health

<http://www.wileyonlinelibrary.com/journal/wmhp>

Many effects of climate change are already evident globally, with grave implications for human health, and conditions expected to become more acute over time. Health impacts occur in cascading and overlapping categories, including infectious disease, disaster preparedness, migration, nutrition, and mental health, to name just a few, with disparate outcomes experienced among already marginalized groups. Policymakers, public health and medical professionals, and related communities of researchers and scholars, can contribute to advancing understanding of present and anticipated health threats, and mitigating adverse consequences of climate change on health.

The Editors of *World Medical & Health Policy*, in collaboration with the **World Medical Association**, are issuing a call for papers on “**Climate Change and Health**” with the goal of bringing attention and contributing understanding to improve policy related to climate change and health around the world. Manuscripts on all aspects of health and wellbeing related to climate change will be considered, including original research articles, commentaries and book reviews that advance empirical, theoretical, methodological or ethical insights that address this fast developing crisis. The special issue on Climate Change and Health will feature a Guest Editorial by **Ed Maibach**, **Director** of the **Center for Climate Change Communication** at George Mason University.

**Abstract submission deadline (250 words): February 17, 2020**
